

# iTrust2 - HCP View

Bijo Joseph, Srilatha Bekkem, Zelin Sun

## Background

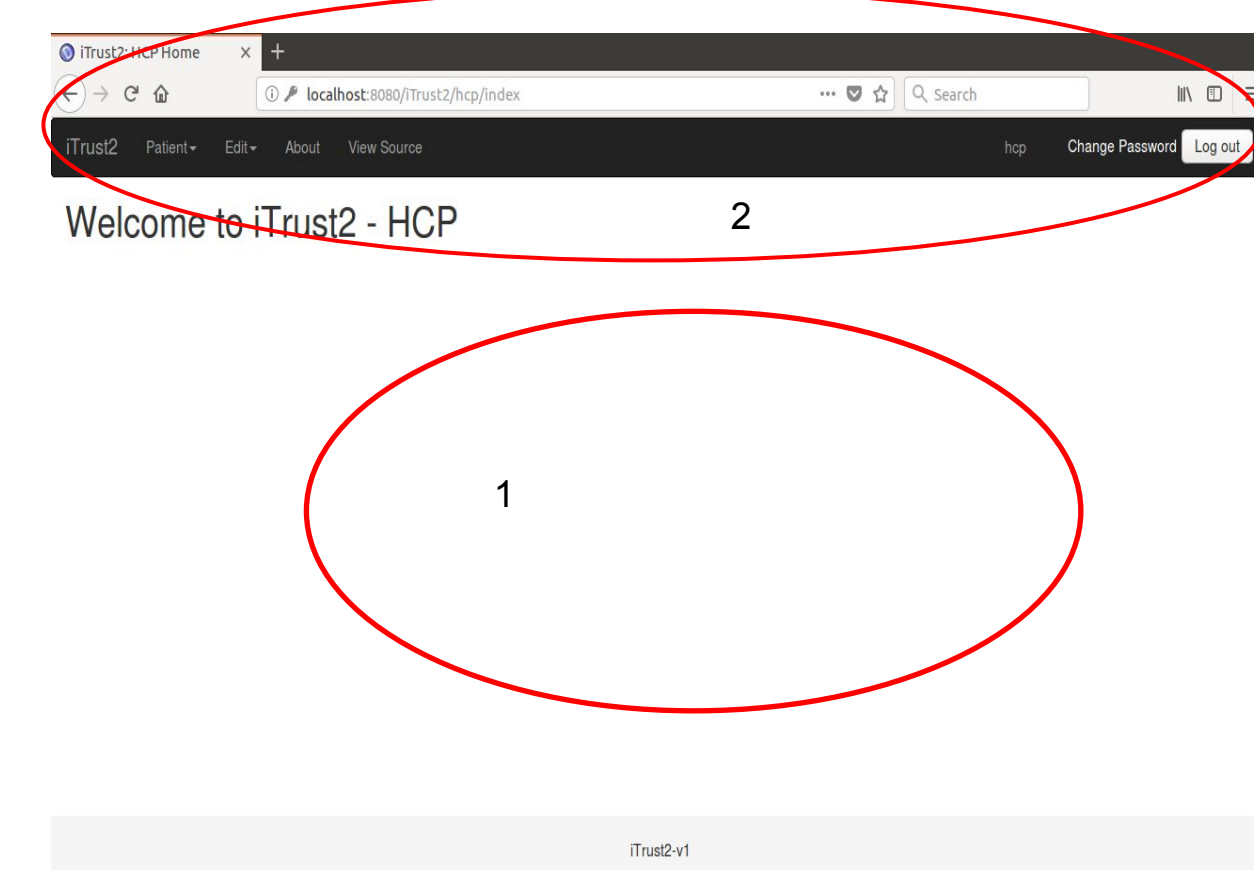

**iTrust2 is an application that enables health care providers to view appointments, obtain and share essential patient information, document patient's office visit and view aggregate patient data.**

Our goal is to design and develop an application interface that improves the experience of a **health care provider**.

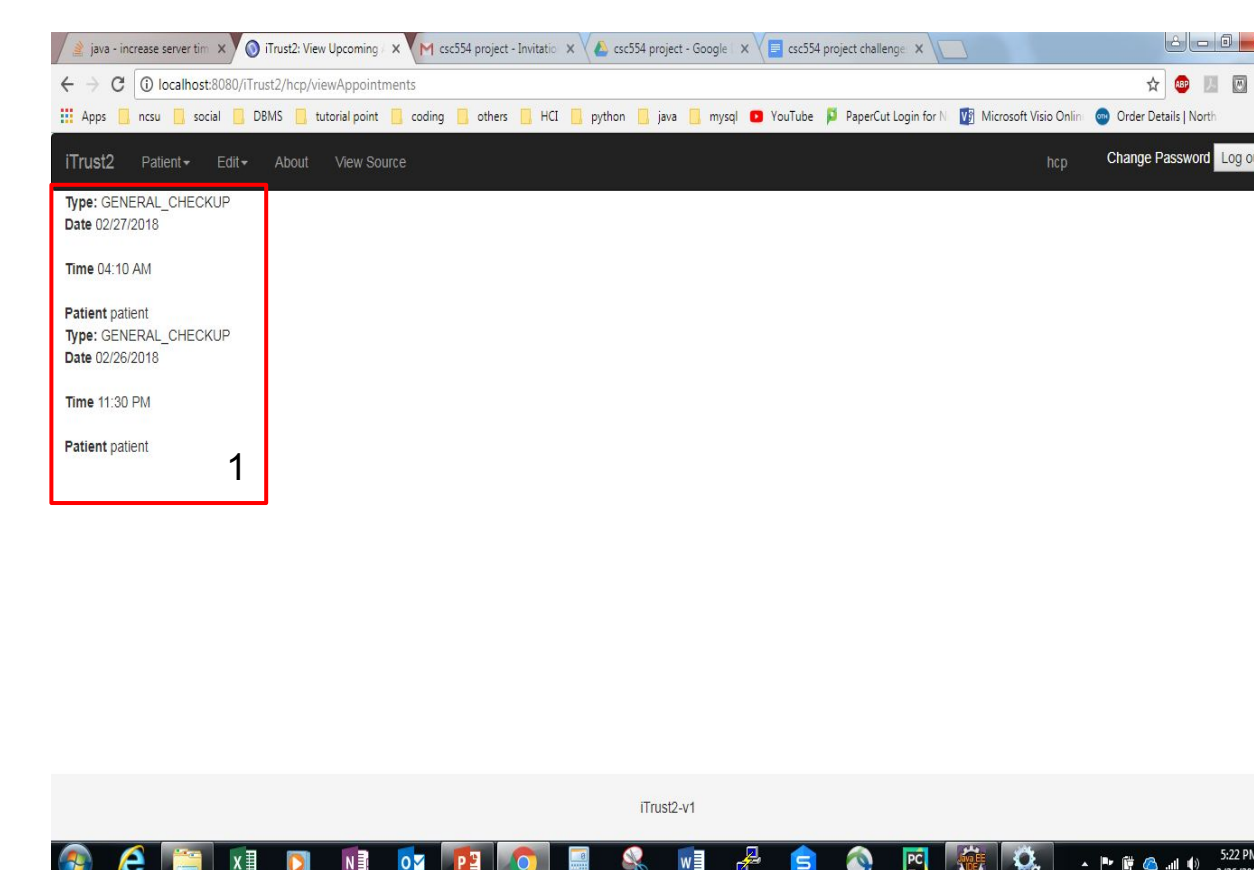

## Current Experience Challenges

- 1.The homepage has a lot of unused space.
- 2.Data entry fields are ambiguous to fill.
- 3.Cluttered display of requested appointments and scheduled appointments.
- 4.Tasks such as edit patient, edit demographics, edit prescriptions are either non-functional or difficult to use.
- 5.Inadequate feedback on form submission.
6. In document office visit page, the page lengthens as the number of patients increase.

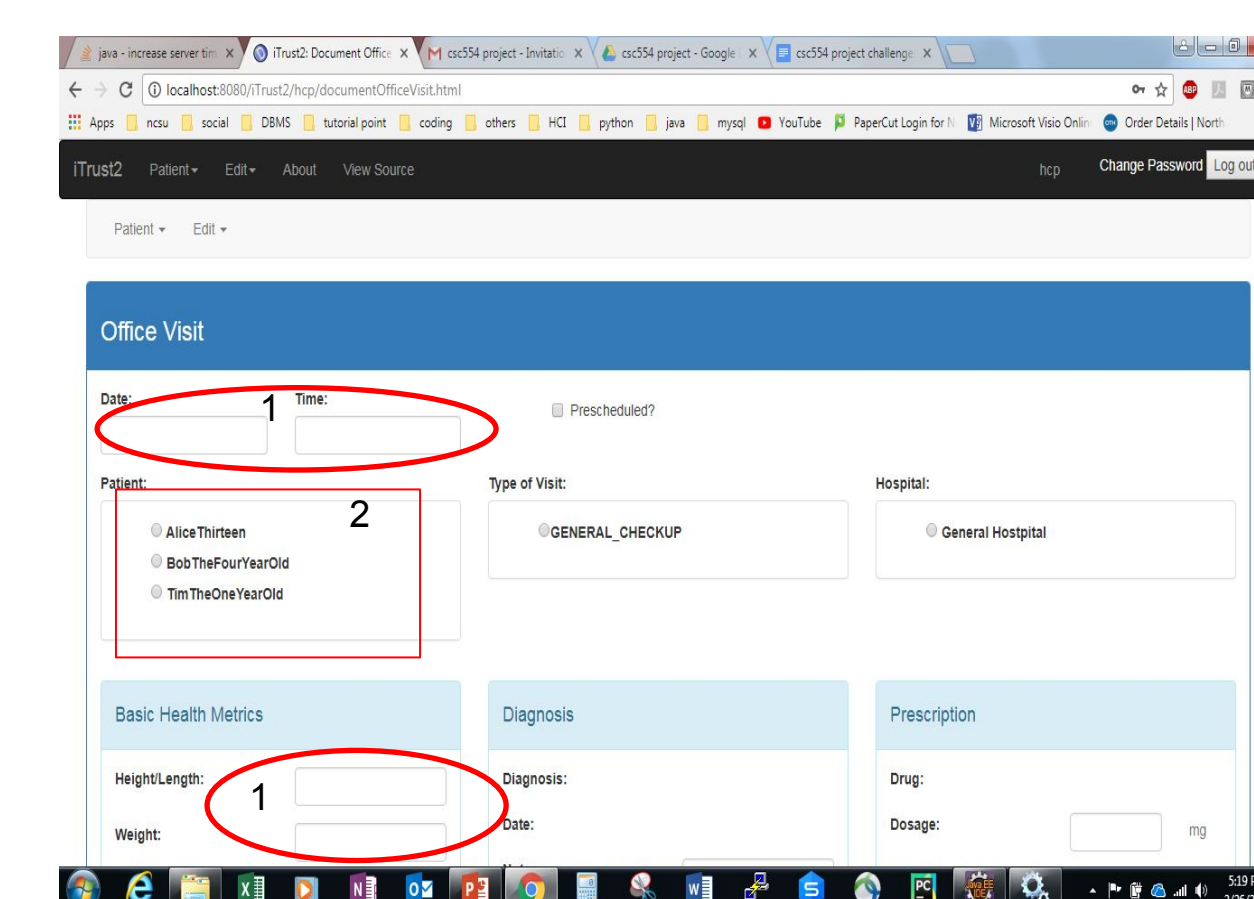

## Examples of Existing System Challenges

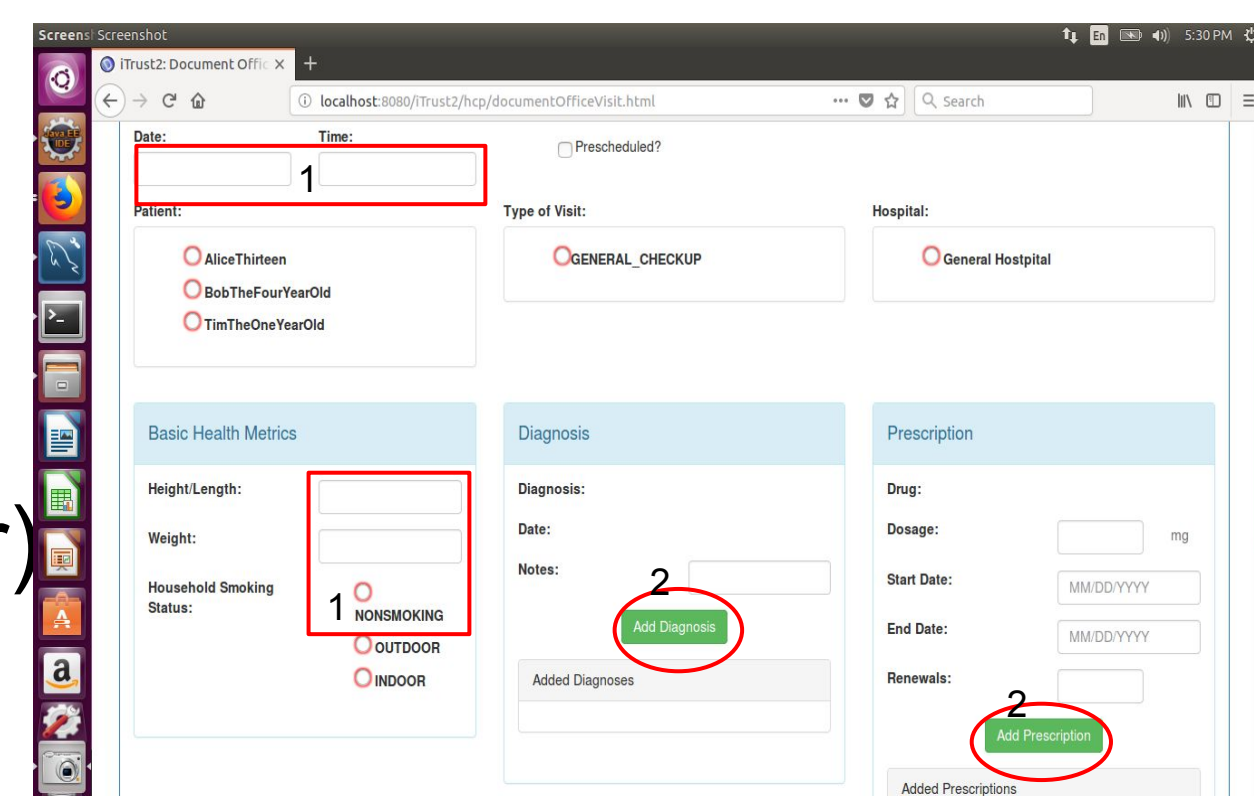

- 1.unused space.
2. too many menu options.

- 1.Inconvenient to view patient list. (e.g. multiple requests, chronological order)

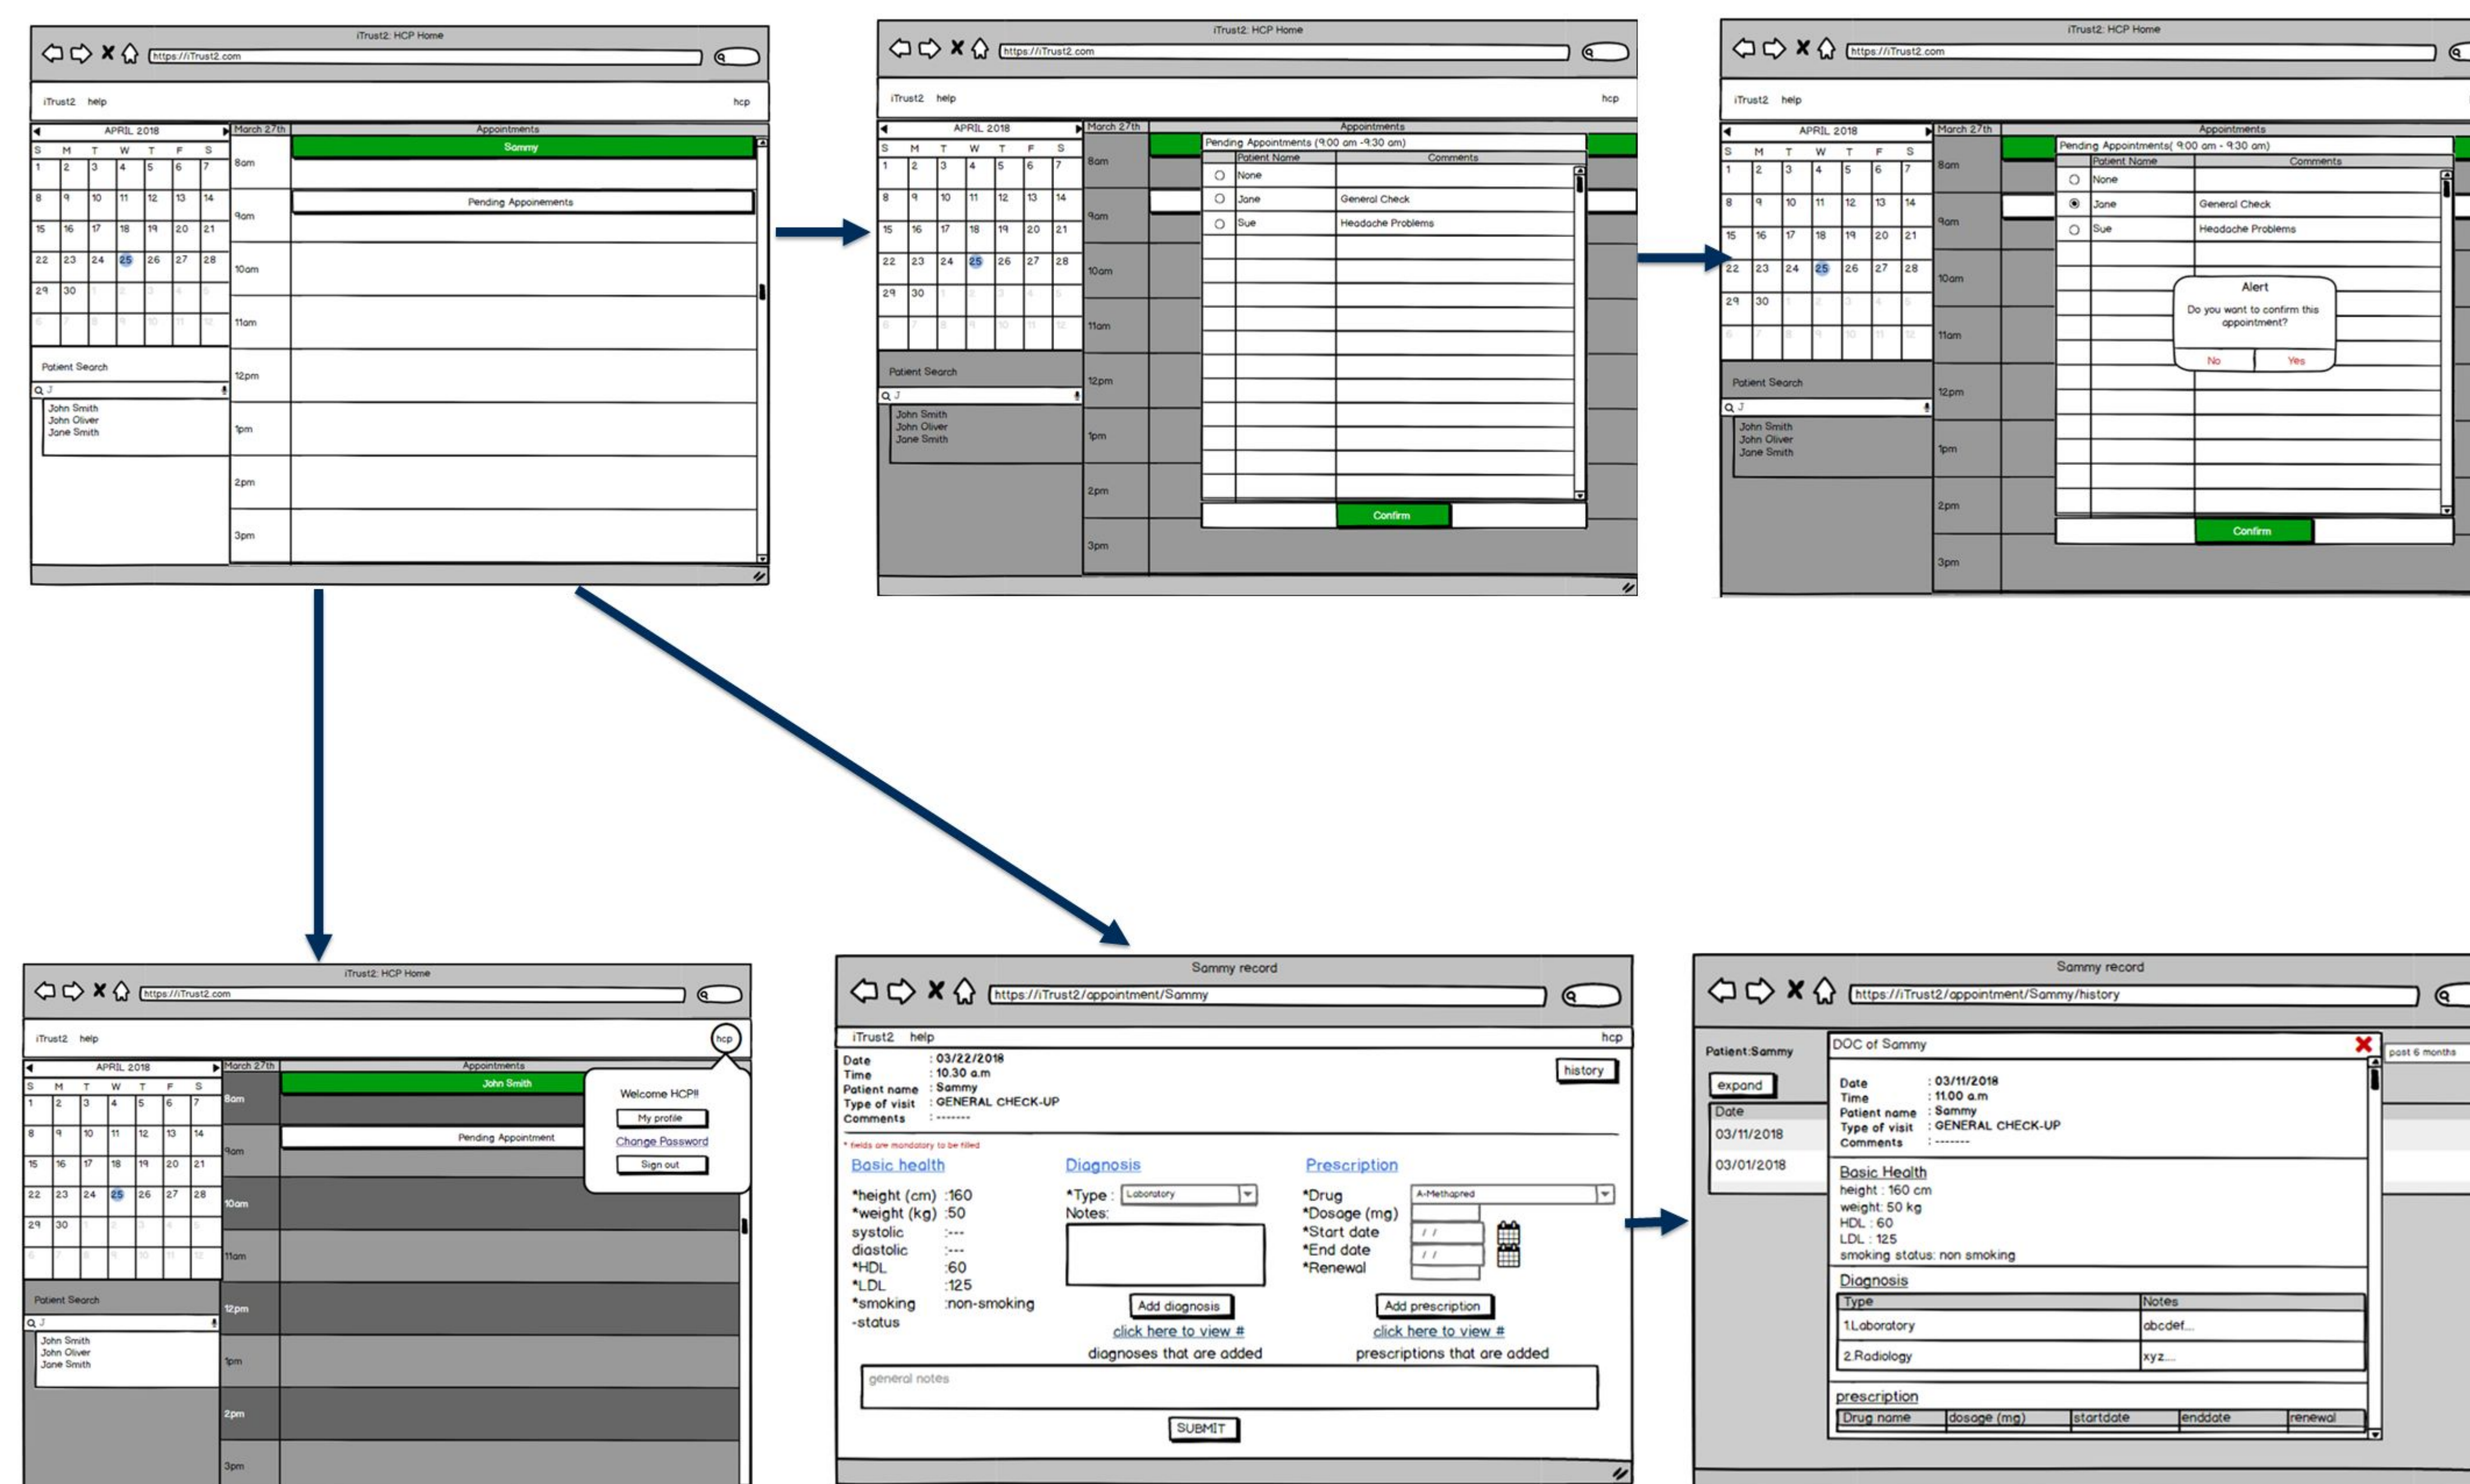

- 1.mandatory data entry fields are not explicitly indicated.
- 2.Accumulation of patient list

- 1.Data entry fields are ambiguous(units of height, weight etc)
- 2."Add prescription" and "Add Diagnosis" functions do not work

## Initial Wireframes and/or Photos of System Improvements

## Procedures

- 1.Team met to understand the existing system and the goals of the project.
- 2.Gathered opinions on the existing system from each team member and noted challenges of the project.
- 3.Proposed solutions to address each challenge and sketched low fidelity paper prototypes.
- 4.Improved the designs and created wireframes.
- 5.Prepared questions for the questionnaire and created usability test script.
- 6.Conducted usability test - one on one session with six people.
- 7.Improved wireframes based on feedback received during usability test.
